

OCRBOT USER GUIDE

1. INTRODUCTION

OCRBot is a desktop application designed to transform scanned PDFs and image-based documents into accessible, searchable, and compliant PDF files. By leveraging Azure AI services, OCRBot extracts text through Optical Character Recognition (OCR) and applies semantic tagging for PDF/UA accessibility compliance.

2. PREREQUISITES

OCRBot requires two Azure AI services to function:

1. **Azure Document Intelligence (Required)**
 - Purpose: Performs OCR operation from scanned PDFs
2. **Azure OpenAI (Required for Auto Tag feature)**
 - Purpose: Generates semantic tags for PDF/UA compliance

3. FIRST LAUNCH CONFIGURATION

When you launch OCRBot for the first time, the Settings window will automatically appear. Follow these steps:

1. **Configure Features**
 - Enable Text Extraction Export when checked OCR text will be saved as a separate .txt file alongside the processed PDF.
 - Enable Auto-Tagging when checked allows automatic tagging of PDF documents using Azure OpenAI. This will show the Auto Tag option in the main window and requires Azure OpenAI configuration.
2. **Configure Default Directories**
 - Input Directory (Required): Where you store PDFs for processing
 - Output Directory (Required): Where processed PDFs will be saved
3. **Enter Azure Document Intelligence Credentials**
 - Endpoint: Your Azure Document Intelligence endpoint URL
 - API Key: Your subscription key from Azure Portal
4. **Enter Azure OpenAI Credentials**
 - Endpoint: Your Azure OpenAI endpoint URL
 - API Key: Your Azure OpenAI subscription key
 - Deployment Name: Name of your deployment

5. Save Settings

- Click Save Settings to store credentials securely in Windows Credential Manager

4. USER INTERFACE OVERVIEW

The OCRBot interface is designed for simplicity and efficiency, featuring four main areas:

1. Header Bar

- Located at the top right of the window, the header bar contains
- Help Button: Access user guide, FAQs, and release notes
- Logs Button: Open the application logs directory to access logs
- Settings Button: Access configuration for Features, Directories and Azure service end points

2. File Selection Area

- Choose Files Button: Click to open file browser and select PDFs
- Choose Folder Button: Click to process all the PDFs in the folder
- Supports up to 6 files maximum for processing
- Displays selected files with ability to remove individual files
- Clear All button to remove all selected files

3. Processing Options

- Text Only Mode checkbox: When selected creates PDF with visible text only (no background images). Useful for reducing file size or focusing on text content
- Auto Tag checkbox: This option is shown only when you enable Auto-Tagging in settings. When selected Adds PDF/UA accessibility tags using AI. Increased processing time.
- Start Processing Button: Initiates PDF processing (enabled when files are selected)

4. Status Bar

- Located at the bottom of the window:
- Status Text: Shows current application state and file processing information

5. PROCESSING PDFS

1. Add Files

- Select files using Choose Files or Choose Folder buttons

2. Select Processing Options

- Choose Text Only Mode and/or Auto Tag (available when you enable Auto-Tagging in settings) based on your needs

3. Start Processing

- Click Start Processing button
- Monitor Progress watch real-time status updates for each file

4. Access Results

- Click Open Output Folder to view processed files

6. UNDERSTANDING OUTPUT FILES

1. File Naming Convention

- a) Processed files are automatically named using the original file with a `_processed` suffix
 - Original: `document.pdf`
 - Processed: `document_processed.pdf`
- b) If a file with the processed name already exists, a numeric suffix is automatically appended and incremented
 - `document_processed_1.pdf`
 - `document_processed_2.pdf`
 - And so on...

2. PDF Structure and Content

Depending on the processing mode, the output PDFs are searchable, allowing text to be selected and copied

Searchable PDF(Default):

- Original page images (preserved)

Text-Only PDF:

- Visible black text on white background
- Page dimensions match original document
- No images or graphics

Tagged PDF (with Auto Tag):

- All content from base mode (Searchable or Text-Only)
- PDF/UA structure tags

7. TROUBLESHOOTING

1. Connection Test Failures

If connection tests fail in the Settings window, try the following:

Check Endpoint URL:

- Verify the endpoint URL is correct

- Ensure URL includes https:// prefix
- Remove any trailing spaces

Verify API Key:

- Copy the API key exactly
- Ensure there are no extra space before or after the key

Network Issues:

- Confirm you have an active internet connection
- Check firewall/proxy settings
- Ensure Azure endpoints are not blocked by network restrictions

2. Processing Errors

If files fail to process, consider the following solutions:

Invalid PDF Files:

- Confirm the file is a valid PDF and not corrupted
- Verify the file by opening it in Adobe Acrobat

Encrypted or Password-Protected PDFs:

- Remove any password protection or encryption before processing

Large Files or Many Pages:

- Processing times increase with higher page counts.
